

## Client Change Options

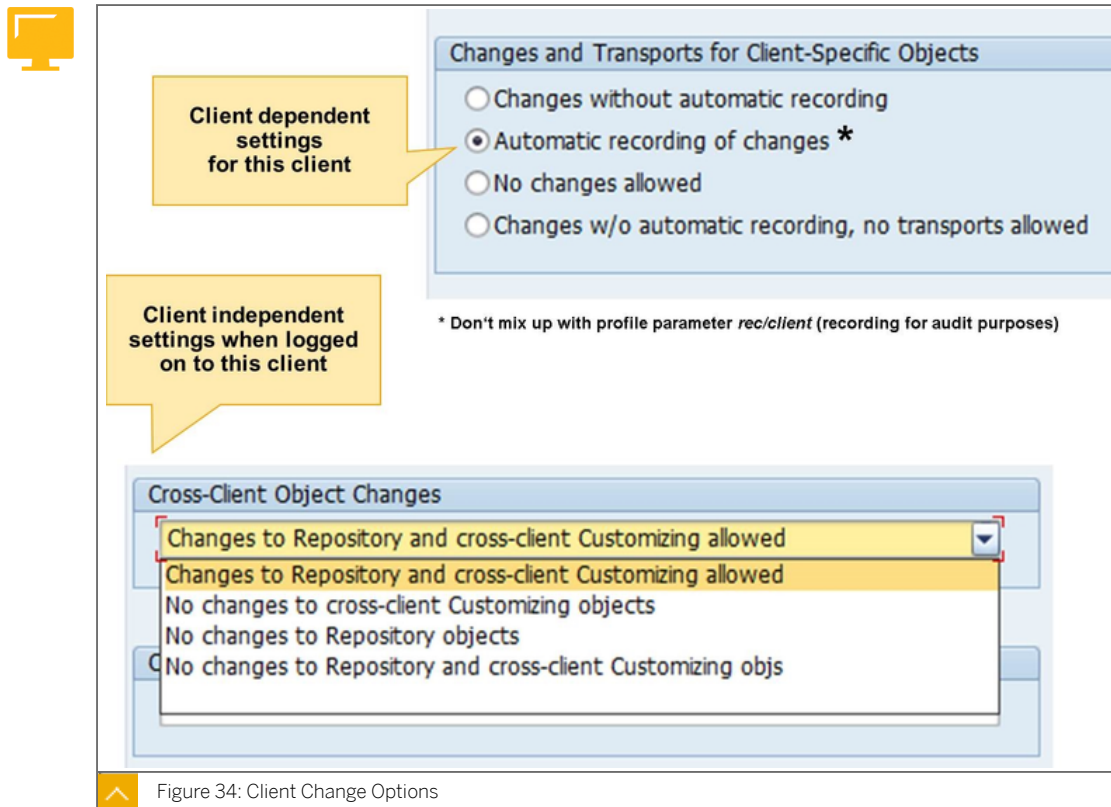

Figure 34: Client Change Options

Client change options, found in the client's *T000* master table, can be maintained using transaction *SCC4*.

Two settings must be maintained to implement controls on where changes are made, and to enforce the changes being recorded to transport requests.

These settings are as follows:

- Changes and transports for client-specific objects.
- Client-independent object changes.

The following list provides a brief description of what each option allows. Changes and transports for client-specific objects are as follows:

### Changes without automatic recording

This flag means that changes in the customizing settings of the client are permitted. The changes are not automatically recorded in a transport request.

Customizing settings can be exported from the client by manually creating a transport request. A manual transport can be carried out in the particular transaction (if possible) or manually.

This variant makes sense for pure test, training or demonstration clients.

### Automatic recording of changes
