

Only use this if the customizing client is separate from the development client.

### No changes to repository and cross-client customizing objects

This is a combination of both restrictions:

- Neither client-independent customizing objects, nor objects of the SAP repository, can be maintained in the client.

Use this in every client in the landscape, except for the customizing and development clients.

Note:

Please note that *Automatic recording of changes* does not refer to recording for audit purposes. Recording for audit purposes is also possible.

To record data changes from within the SAP system, you can set the profile parameter: *rec/client*, via transaction **RZ10**.

To record data changes caused by importing transport requests, you can set the *tp* parameter: *RECCLIENT*, via transaction **STMS**.

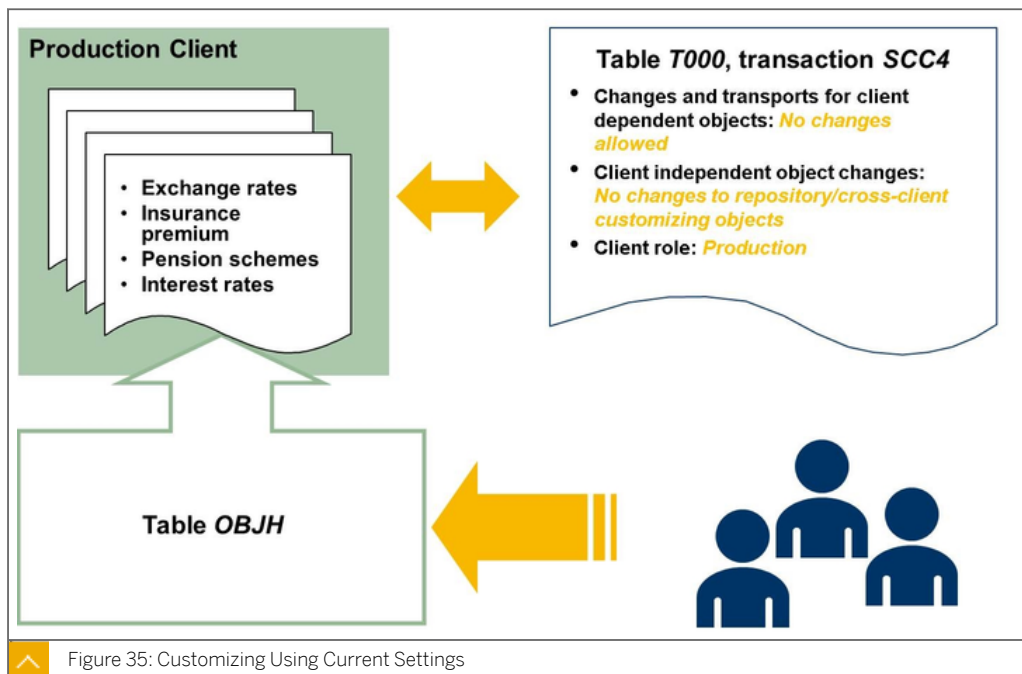

Figure 35: Customizing Using Current Settings

In a customizing project, and also during the maintenance of a SAP system, all customizing changes should be transported and tested in the quality assurance system. But certain kinds of customizing changes, so called data-only customizing changes, need to be carried out in a production client — without being saved as transport requests. Examples of such data, which may require frequent adjustment in SAP systems, include:

- Interest Rates
- Health Insurance Premiums
